

C# notes

All of this is the criteria for the Project submission but I just copy and pasted what I did in a compiler into this

Variables/ data types: Done

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text.RegularExpressions;

namespace HelloWorld
{
    public class Program
    {
        public static void Main(string[] args)
        {
            int Numberofsmiles = 53;
            Console.WriteLine(Numberofsmiles);
        }
    }
}
```

Creating a conditional statement: done

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text.RegularExpressions;

namespace HelloWorld
{
    public class Program
    {
        public static void Main(string[] args)
        {
            bool Numberofsmiles = true;

            if (Numberofsmiles)
            {
                Console.WriteLine("Wowimsohappy");
            }
        }
    }
}
```

```

    }
    }
}

```

Loops: done

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Text.RegularExpressions;

```

```

namespace HelloWorld
{
    public class Program
    {
        public static void Main(string[] args)
        {
            int smiles = 0;
            while (smiles < 10)
            {
                Console.WriteLine("Iseesomeonesmiling!");
                smiles++;
            }
        }
    }
}

```

Function: Done (this took me way too long)

```

using System;

class Program
{
    // Function that adds two numbers
    static int AddNumbers(int a, int b)
    {
        return a + b;
    }

    static void Main()
    {
        int result = AddNumbers(4, 5);

        Console.WriteLine("Result: " + result);
    }
}

```

```
}
```

```
Access level: Done  
using System;
```

```
class Person  
{  
    // Public variable - can be accessed from outside the class  
    public string name = "Graham";  
  
    // Private variable - can only be accessed inside this class  
    private int age = 14;  
  
    // Public method to display the private variable  
    public void ShowAge()  
    {  
        Console.WriteLine("Age: " + age);  
    }  
}
```

```
class Program  
{  
    static void Main()  
    {  
        Person person = new Person();  
  
        // Accessing the public variable  
        Console.WriteLine("Name: " + person.name);  
  
        // Cannot do this because age is private  
        // Console.WriteLine(person.age);  
  
        // Accessing private data through a public method  
        person.ShowAge();  
    }  
}
```

```
using System;  
using System.Collections.Generic;  
using System.Linq;  
using System.Text.RegularExpressions;
```

```
namespace HelloWorld
```

```

{
    public class Program
    {
        public static void Main(string[] args)
        {
            public int Pizzapie = 100;

            private string secretsauce = "top secret ingredient"
        }
    }
}

```

Arrays/lists: done

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Text.RegularExpressions;

```

```

namespace HelloWorld
{
    public class Program
    {
        public static void Main(string[] args)
        {
            int [] numbers = {5,10,15,20};
            Console.WriteLine(numbers[0]);
        }
    }
}

```
